"Metallographic Microscope for Research Work Outside the Laboratory," L. Elim, A. Dyatlov, A. Verkhoshapov, 2 pp

"Morskoy Flot" No 12

Authors have adapted a normal microscope into a portable unit which can be used to conduct metallographic studies of damaged ship parts which cannot be brought to the laboratory. Found 50-300 magnification range most suitable for this work. Gives details and diagrams of construction. Instruments can be prepared at any ship-repair yard, which should facilitate its widespread use.

Inst Title : Effect of Forage Reserves of Large Gerbil (*Rhabdomys opimus* Licht.) on Numbers and Distribution of Fleas in Burrows.

Orig Pub : Zool. zh., 1956, 35, No 9, 1406-1409

Abstract : Observation of insecticidal effect of ferula leaves of *Ferula assafoetida* and wormwood *Artemisia terrae albae* on fleas (species not stated) of large gerbil. In test tubes the average lethal exposure for fleas (observations on 5% specimens) of ferula fresh leaves (2 cm<sup>2</sup> of leaf surface per test tube) and of wormwood is respectively 6 and 4 hours; of dry leaves, 9 and 25 hours. Thus, in a dry form ferula acts on fleas more effectively

AUTHORS: Dyatlov, A.V. and Khokhlov, S.F.

TITLE: On the theory of disc pulverizers

PERIODICAL: Referativnyy zhurnal. Mekhanika, no. 9, 1961, 36-37,  
abstract 9 B227 (Tr. Dnepropetr. khim.-tekhnol. in-t,  
1960, no. 10, 27-36)

TEXT: Some problems of the theory of disc pulverizers of liquids are exposed which allow the approach to the design of these pulverizers. Stationary flow of liquid from the center to the circumference of a rotating disc is considered. A non-linear differential equation of motion of the liquid is obtained in vector form and in polar coordinates. Results of numerical integration of the equation are given: Graphs of variation of radial acceleration and angular velocity of a particle of liquid with time, absolute and relative trajectory of motion of the particles of liquid on the disc. Motion of a very thin layer of liquid on a smooth disc is

Card 1/2

D234/D505

On the theory...

considered. An approximate solution of the problem is obtained when the law of velocity distribution along the height of the layer is given. The case of motion of liquid is analyzed. Formulae are obtained for the trajectory, time of motion in the canal and radial velocity of a particle of liquid at the moment of leaving the disc. A formula is given for designing the power of the motor driving the disc, also a formula for designing the efficiency of the disc pulverizer. 7 references. Abstracter's note: Complete translation

TITLE: Tactical training of navy fliers

33  
33

SOURCE: Morskoy sbornik, no. 12, 1965, 38-42

TOPIC TAGS: naval aircraft, naval training, tactical warfare

ABSTRACT: Suggestions for improving the organization of tactical training of navy fliers are offered by *Morskoy sbornik* readers. The name of each reader appears in brackets following his comments. The independent solution of a complex tactical problem by each member of the crew is suggested as a means of improving the level of tactical training. The five-point system for evaluating the tactical level of pilots and navigators should be replaced by exams [Dyatlov]. Training flight exercises and combat problems should be carried out in conjunction with other flight groups, ships and naval units. Joint planning of such tactical exercises would involve all participating naval units. The Black Sea fleet has tried joint training exercises with good results. In these exercises, representatives of the air arm should be stationed on

Card 1/2

L 43075-66

ACC NR: AP60154(0)

ships to direct flights, and promote flight safety. Closer collaboration between ASW ships and ASW aircraft is urged [Balabasev]. It is proposed that pilots be confronted with unfamiliar situations (in which they are supplied with insufficient data and a short time in which to react) so that they may learn how to react correctly and unhesitatingly in critical situations. The individual approach to the solution of tactical problems is deemed time-consuming and unsuited to naval aviation [Sychev].

TITLE: Pneumatic-mechanical fuel atomization in gas turbine engines

PERIODICAL: Reaktivny zhurnal, Silovyye ustavovki, no. 4, 1962, 36, abstract 42.4.229 "Tr. Kazansk. aviat. in-ta" 1960, no. 55, 63-74

TEXT: Results are given of comparative experimental investigations regarding the quality of atomization and the combustion process in the case of pneumatic-mechanical and mechanical fuel atomization in gas turbine engines. The ordinary two-channel fuel-air engine Φ P-3 (FR-3) injector and the newly designed fuel-air injector with pneumatic atomization are compared. Graphs show the dependence of fuel drop size on injection pressure, as well as its distribution over the cross section of the atomizing cone for both injectors. For pneumatic-mechanical atomization, the average fuel drop volume (under experimental conditions) is 80-88 times smaller than for mechanical atomization. In the case of high uniformity of atomization in the cross section and an air pressure range of 3 to 30 at the fuel-air injector improves the combustion process in the gas turbine engine (especially under conditions of little gas and at high altitude), facilitates the use of heavy fuels, improves the starting properties of the gas turbine engine, reduces the length of the combustion chamber, etc.

ORG: Kazan Aviation Institute (Kazanskiy aviationsionnyy institut)

TITLE: Approximate calculation of a fuel evaporator

SOURCE: Kazan. Aviationsionnyy institut. Trudy, no. 76, 1963. Aviationsionnye dvigateli (Aircraft engines), 89-105

TOPIC TAGS: turbojet engine, afterburner performance, thrust augmentation, heat exchanger

ABSTRACT: When the length of a turbojet engine afterburner is increased to improve its performance, engine economy is reduced under flight regimes without afterburning. This improvement may be achieved, however, without sacrificing economy, by injecting fuel into the afterburner as a vapor rather than in the liquid state as commonly practiced. The article presents an approximate method for calculating the evaporator (heat exchanger) for heating the fuel to the required temperature. The following formulas are derived for calculating the total heat transfer surface area of the exchanger and the gas flow through it, respectively:

$$\Sigma F = \frac{C_1(t_b - t_{in}) + \frac{KT}{M}}{K_1 \Delta t'_{av}} + \frac{C_2(t_w - t_b)}{K_2 \Delta t''_{av}}$$

Card 1/2

L-21491-66

ACC NR: AT6007560

where  $\Sigma F$  is total area;  $t_b$ , mean fuel-boiling temperature;  $t_{in}$ , fuel inlet temperature;  $K$ , overall heat transfer coefficient;  $T$ , absolute temperature;  $M$ , fuel molecular weight;  $t_v$ , vapor temperature;  $K_1$ , heat transfer coefficient for heating zone;  $K_2$ , heat transfer coefficient for boiling zone;  $\Delta t'_{av}$ , average temperature increase in boiling; and  $\Delta t''_{av}$ , average temperature rise in superheating.

$$C_g = \frac{Q}{3600 C_p \Delta t_g} \text{ kg/sec}$$

where  $C_g$  is the gas flow rate;  $Q$ , quantity of heat released from gas to exchanger surface;  $C_p$ , fuel vapor heat capacity; and  $\Delta t_g$  is the gas temperature drop at the exit from exchanger,  $^{\circ}\text{C}$ . Orig. art. has: 54 formulas, 1 table, and 7 figures. [AS]

ORG: Kazan Aeronautical Institute, Kazan (Kazanskiy aviatcionnyy institut)

TITLE: Boiling characteristics of aviation fuels at higher pressures

SOURCE: Kazan. Aviatcionnyy institut. Trudy, no. 76, 1963. Aviatcionnyye dvigateli (Aircraft engines), 106-116

TOPIC TAGS: liquid fuel, ~~boiling point~~, ~~fuel boiling temperature~~ jet fuel, kerosene, boiling, high pressure research, temperature, combustion chamber, gas turbine / TC-1 jet fuel, T-1 jet fuel

ABSTRACT: This is an experimental study of fuel boiling fractions dependence upon temperature, at higher pressures. This information is important in the design of gas turbines, e.g. in the dimensioning of heat exchange surfaces in the combustion chambers. This study is also an experimental verification of theoretical expressions for the average boiling point of fuels at high pressures, published earlier (Dyatlov, I.N., Kazan. Aviatcionnyy institut, Trudy, no. 76). A fractional distillation unit was used. The fuel ( $200 \text{ cm}^3$ ) was enclosed and heated until the desired pressure was reached and kept constant by a release valve leading into a condenser. The temperature was increased in steps until 95-97% of all fuel boiled out at the intended pressure. The results are presented in graphs and tables, for pressures from  $1 \text{ kg/cm}^2$  to  $21 \text{ kg/cm}^2$ , for kerosene type jet fuels TC-1 and T-1. This enables the determination of the boiled-out fraction

Card 1/2

L 22006-66

ACC NR: AT6007561

dependence upon temperature at arbitrary pressures. The results show that, at high pressures, the temperature increment of higher fractions increases sharply beyond the 50% boil-out point. The average temperature of the fuel was defined as the thermal capacity weighted average of the fuel fraction temperatures,  $T_i$  :

$$T_{av} = [c_1(T_1 - T_0) + c_2(T_2 - T_1) + \dots + c_k(T_k - T_{k-1})]/c_{av} \quad (1)$$

with  $c_i$ 's - the individual thermal capacities of the fractions. The previously developed theoretical formula for the average boiling temperature of the (kerosene) fuels at higher pressures, (2), was found to give satisfactory results. The formula is:

$$T_f(P) = (30.6 P^{23} + 201) \cdot T_f(P_0)/T_h(P_0), \text{ } ^\circ\text{K} \quad (2) \text{ where -}$$

$T_f(P)$  - average boiling temperature of the fuel at the design pressure  $P$ ;  $T_f(P_0)$  and  $T_h(P_0)$  - average boiling temperature of the fuel and of hexane, respectively, at the atmospheric pressure,  $P_0$ . The theoretical formula (2) was found to give somewhat lower temperatures than the experimental ones, obtained by the application of expression (1) to the actually obtained experimental data for the fractions. Orig. art. has: 7 figures, 4 formulas and 3 tables.

..... experimental study of a fuel evaporator

SOURCE: IVUZ. Aviatsionnaya tekhnika, no. 1, 1965, 124-131

TOPIC TAGS: fuel evaporator, evaporator, jet aircraft, fuel feed system

ABSTRACT Two types of fuel evaporators, one a dismountable, vertical-tube evaporator and the other a coil-type evaporator, were constructed and tested to verify methods previously developed by the author for calculating the heat transfer surface. In both designs, the fuel (T-1 kerosine) flowed inside the pipes, and the hot gas outside. Tests were made at hot-gas temperatures of 705 and 635°C, gas flow velocities of 195—264 m/sec, and fuel flow rates of 50—250 kg/hr. The experimental and calculated heat transfer surface areas (within a range of 0.02 m<sup>2</sup>) were in agreement. Orig. art. has: 8 figures and 10 formulae. (PV)

Title : Asymptotic Theory of Meson-Meson Scattering

Orig Pub : Zh. eksperim. i teor. fiziki; 1956, 30, No 2, 416-419

Abstract : There exist an infinite number of meson-meson scattering diagrams, the contribution of which the scattering amplitude is of the same order as the contribution of the simplest scattering diagram (square). It is shown that the sum of such diagrams (i.e., the meson-meson scattering amplitude in the approximation by L.D. Landau, A.A. Abrikosov, and I.M. Khalatnikov) is the solution of the integral equation can be determined provided the contribution of the simplest scattering diagrams (squares) is known. The solution of the equation for large meson momenta shows that the contribution of all the diagrams is of the same order of magnitude as the contribution of the simplest ones. This circumstance is of importance to the conclusion that the meson charge is zero.

TITLE: Bremsstrahlung of  $\pi$ -Mesons and Production of  $\pi$ -Meson Pairs by  $\gamma$ -Quanta in Collisions With Nonspherical Nuclei  
(Formoznoye izlucheniye  $\gamma$ -kvantov  $\pi$ -mezonomi i obrazovaniye  $\pi$ -mezonnnykh par  $\gamma$ -kvantami pri stolknovenii s nesfericheskimi yadrami)

PERIODICAL: Zhurnal Eksperimental'noy i Teoreticheskoy Fiziki, 1958,  
Vol. 34, Nr 1, pp. 80 - 86 (USSR)

ABSTRACT: In the present work the cross sections for some radiation processes taking place on the occasion of an interaction between high-energy  $\pi$ -mesons and nonspherical nuclei are computed. The author investigates the changes of radiation processes on the occasion of collisions of  $\pi$ -mesons with nuclei and of processes of production of  $\pi$ -meson pairs by  $\gamma$ -quanta caused by the nonspherical shape of the nucleus. In this connection a spheroid is used as model of the nucleus which is black in relation to  $\pi$ -mesons. The emission of a  $\gamma$ -quantum by a  $\pi$ -meson consists of the radiation on the occasion of

Card 1/3

56-1-13/56

Bremsstrahlung of  $\pi$ -Mesons and Production of  $\pi$ -Meson Pairs by  $\gamma$ -Quanta  
in Collisions With Nonspherical Nuclei

scattering of the  $\pi$ -mesons and of the radiation on occasion of absorption. According to Landau and Pomeranchuk (reference 1) both parts of radiation can be determined from the wave function for the  $\pi$ -meson outside of the nucleus. This wave equation and one of its solutions are written down here. The expression for the kernel given here can be used in adiabatic approximation. The author then determines the amplitude of scattering by means of emission and excitation of the  $n^{\text{th}}$  state of rotation. The total cross sections of emission on the occasion of scattering on a nonspherical nucleus have the same shape with all nuclei symmetrical about their axes with a given ratio of the semiaxes. The corresponding expression is given here and specialized for particular cases. In the case of heavy nuclei and wide angles the cross section of Bremsstrahlung on the occasion of scattering on nonspherical nuclei differs from the corresponding cross section for the spherical nucleus only by a factor. It is also shortly pointed to the difference in angular distribution. The production of  $\pi$ -meson pairs by an approaching  $\gamma$ -quantum can also be investigated by means of the equation investigated here. Com-

Card 2/3

56-1-13/56

Bremsstrahlung of  $\pi$ -Mesons and Production of  $\pi$ -Meson Pairs by  $\gamma$ -Quanta  
in Collisions With Nonspherical Nuclei

putations are carried out in completely analogous way as in the case of the spherical nucleus. The differences in angular distribution on the occasion of the production of a pair with a spherical and a nonspherical nucleus are the same as in the case of Bremsstrahlung. In the last chapter the production of a  $\pi$ -meson pair by a  $\gamma$ -quantum with subsequent absorption of one of the components of the pair by a nonspherical nucleus is investigated. In this case the angular distribution and the total cross section also differ from the case of a spherical nucleus only by a factor. Concluding, some remarks are made as to the applicability of the formulae obtained here. There are 1 figure, and 6 references, all of which are Slavic.

AUTHOR           DYATLOV, I.T., SUDAKOV, V.V., TER-MARTIROSYAN, K.A.  
TITLE           The Asymptotic Theory of the Scattering of a Meson By a Meson  
                (Asimptoticheskaya teoriya rasseyaniya mezona na mezon. Russian).  
PERIODICAL      Zhurnal Eksperim. i Teoret. Fiziki, 1957, Vol 32, Nr 4, pp 767 - 780  
                (U.S.S.R.)  
ABSTRACT        The paper under review determines the asymptotic behavior for the amplitude of the scattering of a meson by a meson in a theory of the type of the theory devised by Landau, Abrikosov and Khalatnikov. First of all, the authors of the paper under review demonstrate that the sum of the contributions of all reducible graphs satisfies an exact integral equation, the form of which depends only on the contribution of the primitive graphs. The computation is carried out step by step, and the integral equation obtained is written down in its explicit form. With two additional analogous equations a system of three integral equations is obtained, this system defines the functions  $F(k_1, k_2, k_3, k_4)$ ,  $F(k_1, k_3, k_2, k_4)$  and  $F(k_1, k_4, k_2, k_3)$  unambiguously by the known quantity  $R(k_1, k_2, k_3, k_4)$ , i.e. by the contribution of the primitive graphs. Then the integral equation is specialized for the case of high impulses for the neutral and for the symmetrical theory. In the symmetrical theory, it is possible to eliminate from consideration the variables of the isotopic spin of the mesons. The total sum  $P(x)$  of the reducible graphs is a finite quantity of the same order of magnitude as the contribution

Card 1/2

56-4-18/52

The Asymptotic Theory of the Scattering of a Meson By a Meson

R<sub>0</sub> of the primitive graphs. Finally the paper under review discusses the properties of the renormalization of the amplitude P of the scattering of a meson by a meson. At L → ∞, it is possible to automatically normalize the expressions for the sums P(x) and P(ξ), without being forced to introduce into the Hamiltonian terms proportional to  $\phi^4$ . TITLE:

Dispersion Relations for the Electromagnetic Form Factor of  
the  $\pi$ -Meson (Dispersionnyye sootnosheniya dlya elektro-  
magnitnogo form-faktora  $\pi$ -mezona)

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, 1959,  
Vol 36, Nr 2, pp 505-507 (USSR)

ABSTRACT:

For the electromagnetic form factor of the pion it is possible,  
in connection with the imaginary part of the annihilation  
amplitude of two pions, to set up a dispersion relation, which,  
compared to that of the same nature set up by Barnstein and  
Goldberger (Barnshteyn, Gol'dberger)(Ref 1) for nucleons,  
contains no nonphysical domain. In the present paper the author  
derives dispersion relations for the electromagnetic form  
factor of a charged pion. By considering only the contribution  
of a state with two pions in the imaginary part, an equation  
has been obtained, which yields the form factor as a function  
of the  $\pi - \pi$ -meson scattering phase shift. The theoretical  
process is as follows: The analytical properties of a matrix  
element of the electromagnetic current  $j_\mu(x)|_{x=0}$

Card 1/3

Dispersion Relations for the Electromagnetic Form  
Factor of the  $\pi$ -Meson

SOV/56-36-2-23/63

( $\square A_\mu(x) = -j_\mu(x)$ ) between pion states with the pulses  $p'$  and  $p$  and the isotopic indices  $i$  and  $k$ ,  $\langle p', i | j_\mu(0) | p, k \rangle$ , are investigated. From relativistic and isotopic invariance it follows for the gauge-invariant part of this matrix element

that  $\langle p' i | j_\mu(0) | p k \rangle = e(p' - p)_\mu [a_S(q^2) + a_V(q^2)T_3]_{ik}$ , where  $q = p' - p$ ;  $T_3$  is the operator of the third projection of the isotopic spin for  $T = 1$ , and the form factor is

$e a_V(q^2) = \frac{(p' - p)_\mu \langle p' | j_\mu^V(0) | p \rangle}{(p' + p)^2} 2 \sqrt{\omega_p \omega_{p'}}$ . By using the formulae of reference 2 one obtains: ( $a_V(q^2) = a(q^2)$ ):

$$a(q^2) = -\frac{1}{\pi} \int_{q^2}^{\infty} \frac{\text{Im} b(-\xi^2) d\xi^2}{\xi^2 + q^2}, \quad q^2 > 0;$$

Card 2/3

Dispersion Relations for the Electromagnetic Form Factor of the  $\pi$ -Meson

SOV/56-36-2-23/63

$$Reb(q^2) = -\frac{1}{\pi} p \int_2^\infty \frac{\text{Im}b(-\xi^2) d\xi^2}{\xi^2 + q^2}, \quad q < -4\mu^2 \quad \text{where } b(q^2) \text{ is the}$$

"form factor" for pion pair production and/or annihilation.

It holds that  $\text{Im}b(q^2) = \pm |b(q^2)| \sin \delta(q^2)$ , where  $\delta$  is the  $\pi$ - $\pi$ -scattering phase shift ( $l = 1$ ,  $T = 1$ ). For

$q^2 \leq -16\mu^2$  this expression is exact. The author finally thanks I. M. Shmushkevich for suggesting the subject and V. N. Gribov for valuable discussions. There are 4 references, 1 of which is Soviet.

TITLE: Analytic continuation of the three-particle unitarity condition. Simplest diagrams

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42, no.1,  
1962, 196-210

TEXT: The three-particle unitarity condition for the simplest class of diagrams is analytically continued with respect to the transferred momentum  $t$ . Owing to the complex structure of the unitarity condition the method used for determining the spectral functions can hardly be used to determine the high intermediary states and the theory which bases on the analyticity and unitarity conditions cannot be formulated unless simpler and more general principles have been developed for the formulation of the equations. The unitarity condition

Analytic continuation of the three-...

are obtained. When calculating the analytic continuation of the unitarity condition (10) for three particles the analytic properties of the

amplitudes  $A$  and  $A^*$  of the reactions with participation of the five particles which are not yet known for the general case must be known. However, when studying the simplest graph (Fig. 4) of the three-particle-state some general properties of the intermediary state are found if the five-tail amplitudes  $A$  and  $A^*$  have very simple analytic properties. More complex analytic properties of  $A$  and  $A^*$  will be studied in a later paper. The formulas for  $\gamma(s,t)$  obtained in the present paper correspond to the representation by R. Cutkovskiy (J. Math. and Phys., 1, 429, 1960) of  $\gamma(s,t)$  for an arbitrary graph in the form of a Feynman integral if the parts of the internal lines correspond to  $\delta$ -function of  $q_i^2 - m_i^2$ . There

TITLE:

Contribution of three-particle states to the spectral function equation

PERIODICAL:

Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42,  
no. 5, 1962, 1268-1277

TEXT: This paper is published in continuation of a previous article (ZhETF, 42, 1962), in which an expression was found for the Mandelstam function  $\Omega(s,t)$  (cf. Phys. Rev., 112, 1344, 1958), for the simplest class of graphs in perturbation theory, containing three-particle intermediate states (Fig. 1). This spectral function is an integral over five  $\delta$ -functions, which correspond to the inner lines of the graph. It is shown here that a similar procedure can also be applied to far more complicated graphs (Fig. 3), if attention be confined to the abstract representation of the graph (Fig. 4). It can be shown that the field of integration can be made independent of the properties of the amplitudes in respect of variables  $s_{57}$  and  $s_{67}$ , and that the corresponding

S/056/62/042/005/020/050  
B102/B104

Contribution of three-particle ...

function  $q^{(3)}(s,t)$  can be represented (Fig. 2) as an integral over the absorption terms of the amplitudes  $A_1$  and  $A_2$ . The three-particle intermediate state in the unitarity condition supplies a contribution to  $\sigma(s,t)$  in the form of an integral entirely similar to that obtained by Mandelstam for the two-particle state contribution. This enables the graphs to be "divided" for purposes of simpler calculation; any particular diagram with four ends can be analysed into four parts by two divisions, so that one and only one exterior line is associated with each part. The dividing lines replace  $\delta$ -functions of  $p_i^2 - m_i^2$ . Integration is performed over a certain complex domain of the invariant variables, multiplying by a factor which is easily determined from the unitarity condition. Anomalies generate contributions to  $q(s,t)$  expressed, not as ordinary, but as multiple amplitude discontinuities. As in the work previously reported, an expression is derived for  $q^{(3)}(s,t)$  in which  $t = t(s)$  is assumed arbitrary. The expression obtained for  $m_{15}^2 < (m_1 + m_5)^2$  is

TITLE: Anomalous thresholds and interaction in the final state

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 43,  
no. 3(9), 1962, 906-908

TEXT: The authors study the influence of anomalous three-particle production amplitude singularities on the analytical amplitude properties when two of the particles have small energies. It is shown from the example of meson production in meson-nucleon collisions (graph Fig. 1) that the presence of anomalous terms in the dispersion relations do not influence the amplitude expansion in a power series of the threshold momenta. This graph has a logarithmic singularity at  $s = 4\mu^2$  (Sawyer, Phys. Rev. Lett. 7, 213, 1961) and an anomalous one at

$$s_b = \frac{\mu^2(W + 3M^2 - \mu^2)}{2M^3} - i \frac{\mu}{2M^2} \sqrt{4M^2 - \mu^2} [W^2 - 2W(M^2 + \mu^2) + (M^2 - \mu^2)^2]^{1/4}, \quad (1)$$

Card 1/0 3

S/056/62/043/003/026/063

B102/B104

Anomalous thresholds and interaction ...

where  $\bar{w} = (k_1 + p_1)^2$  is the total energy of the system in the c. m. s.,  $M$  the nucleon mass and  $\mu$  the meson mass. For super-threshold energies  $\bar{w} > (M+2\mu)^2$  in dispersion representation

$$A(s) = \frac{1}{\pi} \int_C \frac{A_1(s') ds'}{s' - s} = \frac{1}{\pi} \int_{s_b}^{4\mu^2} \frac{\rho(s') ds'}{s' - s} + \frac{1}{\pi} \int_{4\mu^2}^{\infty} \frac{A_1(s') ds'}{s' - s}; \quad \rho(s') = A_1^+(s') - A_1^-(s'). \quad (2,3)$$

With this separation the logarithmic singularity of the first integral is compensated by the second, so that  $A_1(s)$  is determined by the unitarity condition for  $s > (\sqrt{W} + M)^2$ . For smaller  $s$  it is possible to obtain  $A_1(s)$  as analytic continuation from the region  $s > (\sqrt{W} + M)^2$ . For point vertices and  $s > (\sqrt{W} + M)^2$ ,

Card 2/6 3

Anomalous thresholds and interaction ...

S/056/62/043/003/026/063  
B102/B104

$$A_1(s) = \{s/[s - (\sqrt{W} - M)^2] [s - (\sqrt{W} + M)^2]\}^{1/4} \times \\ \times \ln \frac{s - W + M^2 - 2\mu^2 - \sqrt{(s - 4\mu^2)/s} \{[s - (\sqrt{W} - M)^2][s - (\sqrt{W} + M)^2]\}^{1/4}}{s - W + M^2 - 2\mu^2 + \sqrt{(s - 4\mu^2)/s} \{[s - (\sqrt{W} - M)^2][s - (\sqrt{W} + M)^2]\}^{1/4}}. \quad (4).$$

The amplitude discontinuity at  $s = 4\mu^2$  tends to zero as  $\sqrt{|s-4\mu^2|}$ . Finally the behavior of the singularity of (4) at  $\sqrt{W} \approx M+2\mu$  for the production of three low-energy particles is discussed. There are 3 figures.

TITLE: Electromagnetic meson decays in the quark model

SOURCE: Zhurnal eksperimental'noy i teoreticheskoy fiziki. Pis'ma v redaktsiyu.  
Prilozheniya, v. 1, no. 2, 1965, 50-54

TOPIC TAGS: meson, strange particle, quark model

ABSTRACT: The hypothesis of SU(6) symmetry in strong interactions leads to a large number of relationships between the various matrix elements. In this paper it is pointed out that the use of SU(6) symmetry and the quark model in studying electromagnetic meson decays leads to predictions which may be experimentally verified in the near future. It is suggested that the magnetic moment of a quark may be independent of the type of interaction which binds quarks in particles, as should be the case in the non-relativistic model with weakly bound quarks. TITLE: Three-particle unitarity conditions for complex angular momenta and the Mandelstam branch points

Source: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 48, no. 3, 1965, pp. 1776-1786

TOPIC TAGS: moving pole method, quantum electrodynamics, elementary particle, particle interaction

ABSTRACT: A study is made of the contribution of three-particle diagrams to the unitarity condition for the partial-wave amplitude. The unitarity condition is continued to include up to a large imaginary part of momentum  $j$  in such a way that no singularities of the amplitudes take place for large  $\text{Re } j$ . Special attention is paid to

Card 1/3

L 64748-65

ACCESSION NR: AP5016572

concerns the unitarity condition for the three-particle amplitude. The form of the sum of the products of amplitudes which is consistent with the form used in an earlier article by N.N. Bogoliubov (Preprint, ITEF, 1964) is then obtained. The possibility of carrying down the three-particle unitarity condition in the form of an integral with respect to  $\mu$  is also shown. It is planned to show in a future article (ZhETF, 1966, v. 50, no. 1) that the three-particle amplitudes introduced in the present article can be extended to complex  $\mu$  and have the required properties.
